*(The number of pins can vary, but the order is the same.)*

Sometimes there's a notch at both ends.

Sometimes there's a notch at both ends.

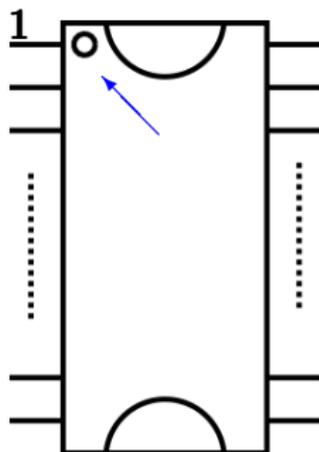

Sometimes there's a notch at both ends.

In this case, there's a dimple in the corner as well which indicates the location of pin 1.

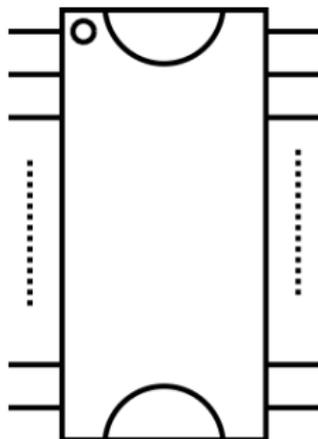

Sometimes there's a notch at both ends.

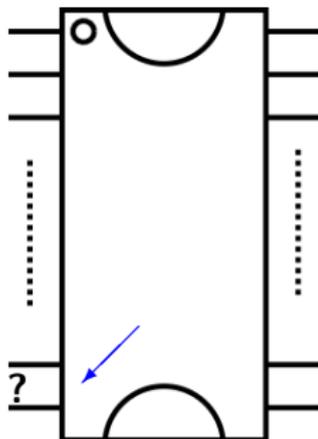

In this case, there's a dimple in the corner as well which indicates the location of pin 1.

Often, *but not always*, GROUND and  $V_{CC}$  are at opposite corners.

Often, *but not always*, GROUND and  $V_{CC}$  are at opposite corners.

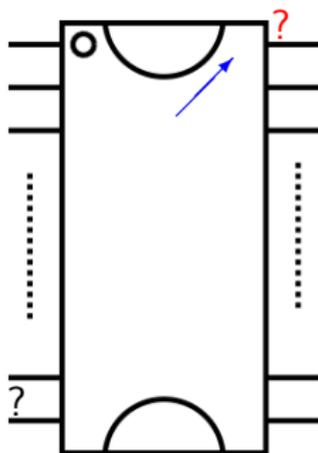

Often, *but not always*, GROUND and  $V_{CC}$  are at opposite corners.

GROUND is usually on the lower left.

Often, *but not always*, GROUND and  $V_{CC}$  are at opposite corners.

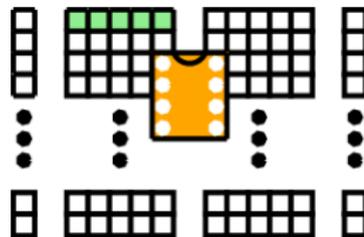

GROUND is usually on the lower left.

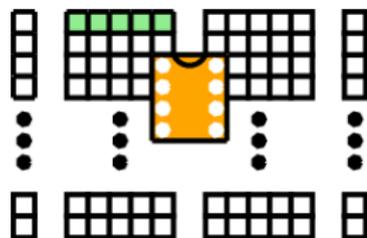

$V_{CC}$  is usually on the upper right.

Here's how it goes on a breadboard.

Here's how it goes on a breadboard.

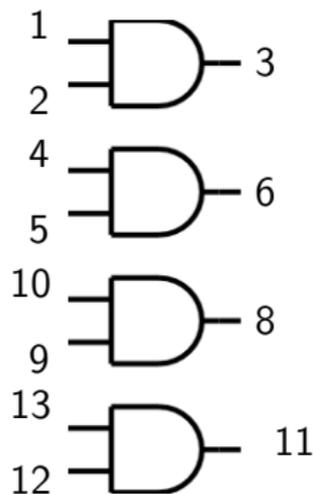

Here's how it goes on a breadboard.

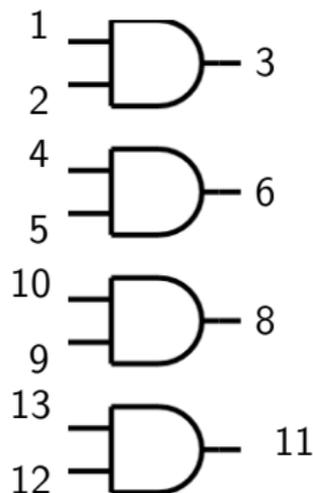

Note the chip should have one row of pins on each side of the central trough of the breadboard.

Sometimes, instead of showing the *physical* layout of the chip, a manufacturer will show the *logical*, i.e. internal, layout.

Sometimes, instead of showing the *physical* layout of the chip, a manufacturer will show the *logical*, i.e. internal, layout.

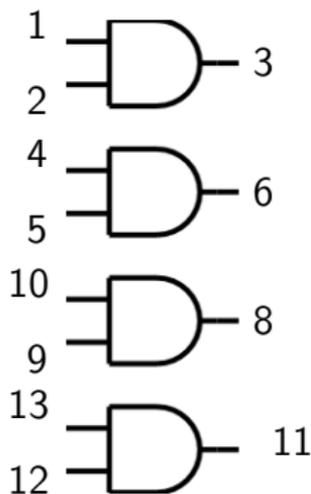

Sometimes, instead of showing the *physical* layout of the chip, a manufacturer will show the *logical*, i.e. internal, layout.

In this case, the pin numbers are shown.

Sometimes, instead of showing the *physical* layout of the chip, a manufacturer will show the *logical*, i.e. internal, layout.

In this case, the pin numbers are shown.

**Note GROUND and  $V_{CC}$  aren't shown. You'll have to look through the data sheet to find out which pins they are.**
